Plant i FUELSAVER

Fuel and CO² Reduction Application

Plant i FUELSAVER Fuel and CO² Reduction Application

Available for all diesel vehicles with the Plant i Fleet Management System to give a genuine 10 - 24% increase in MPG across your fleet.

Concept

In response to the way the government is seeking to link vehicle emissions to vehicle taxation, congestion charging and road tolling, we began, three years ago, looking into ways of reducing vehicle CO² emissions without compromising the power output of the vehicle or its day to day usability. What was discovered was that the emissions could not be looked at in isolation, but the whole combustion and fuel management process needed to be re-examined in order to make the improvements we were seeking.

Our Solution

At Plant i Ltd, we remove the manufacturers programme from the ECU and make a copy, so that the vehicle can be returned to standard at anytime if so required.

The original programme is then completely altered, improved and re-loaded back to the vehicle ECU. From this point on, the vehicle runs at optimum efficiency for UK fuel standards, climate, altitudes and engine conditions, which is how we attain our improved fuel economy and lower the vehicles CO² emissions. All of this is achieved without ever exceeding any of the safe tolerances of the engine; therefore no adverse affect on its life will be seen. In addition, our technology is completely warranted and reversible at anytime if required.

Fuelsaver

- 10 - 24% better MPG
- Lower CO² emissions
- More useable torque
- Apart from saving money, you will be reducing your carbon footprint
- Improved towing capability
